

Abstract

A method for the advertising of freight service between service providers and customers is implemented via a computer network. Through an internet web site interface an individual (carrier, enterprise, etc.), who is in possession of a freight vehicle can post a request for a quotation, which includes all requirements (e.g. routes, time schedule). Another individual (manufacturing company, private person, etc.), who is looking for a freight service can post a request for a quotation, which includes all requirements (e.g. schedule data of the departure and destination locations of the goods). The service provides only the opportunity to find each other. It does not offer any guarantee for service provided and does not establish any contracts. The administrator is neither involved in the contracting procedure nor is aware of any contract concluded. The two parties will be able to contact each other at the addresses specified in their respective announcements.
